No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                       425026

TISSUE SPECIFICITY: IN NORMAL KIDNEY, EXPRESSED PRIMARILY IN THE
MEDULLARY THICK ASCENDING LIMB, WITH MINOR AMOUNTS IN THE
MEDULLARY COLLECTING DUCT AND VASA RECTA BUNDLE.
INDUCTION: BY INTERFERON GAMMA AND LIPOPOLYSACCHARIDE.
SIMILARITY: BELONGS TO THE NOS FAMILY.

"Molecular cloning and characterization of Ca2+-dependent inducible
nitric oxide synthase from quinea-pig lung.";
Blochem. J. 333:795-799(1998).
-I- FUNCTION: PRODUCES NITRIC OXIDE (NO) WHICH IS A MESSENGER MOLECULE
WITH DIVERSE FUNCTIONS THROUGHOUT THE BODD.
NITRIC OXIDE + N NADP(+).
COPACTOR: HEME. BINDS ONE MOLE EACH OF FAD AND FMN. ALSO REQUIRES
TETRAHYDROBIOPTERIN (BH4) WHICH MAY STABILIZE THE DIMERIC FORM OF
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -!- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + N NTRIC OXIDE + N NADP(+).

THE DYSTROPHINTER. ISOFORM NNOS MU MAY BE AN BEFECTOR ENZYME FOR THE DYSTROPHIN COMPLEX.

1- CATALYTIC ACTIVITY: L-ARGININE + N NADPH + M O(2) = CITRULLINE + NITRE OXIDE + N NADP(+).

1- NITRE OXIDE + N NADP(+).

1- COFACTOR: HERE. BINDS OWE MOLE EACH OF FAD AND FMN. ALSO REQUIRES THE ENZYME REGULATOR: STIMULARITY).

1- SUBCHILLATE BENEVER REGULATION: STIMULARITY).

1- SUBCHILLATE ROCATION: STIMULARITY).

1- SUBCHILLATE LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED BENEVERT THE DIMERIZATION OF THE PROTEIN (BY SIMILARITY).

1- SUBCHILLATER LOCATION: IN SKELETAL MUSCLE, NNOS IS LOCALIZED BENEVERT THE DYSTROPHIN GLYCOPOTEIN COMPLEX.

1- SUBCHILLATER LOCATION: IN SKELETAL MUSCLE-SPECIFIC; ARE PRODUCED ALSO FOUND THE SALTERNATIVE SPILICING.

2. NNOS BETA, NNOS GAMAA AND NNOS MU/MUSCLE-SPECIFIC; ARE PRODUCED STERBELLING. PONS, MEDULLA ORDINGATA, AND SPIRAL COMPLEX.

2. NNOS BETA, NNOS GAMAA AND NNOS MU/MUSCLE-SPECIFIC; ARE PRODUCED IN SKELETAL MUSCLE, WHERE IT IS LOCALIZED BENEATH THE SACCOLEMAA OF FAST THICH MUSCLE FIBERS, AND IN SPLEEN HEART, KIDNEY, AND LIVER. NNOS BETA AND GAMAA OCCUR IN A REGION-SPECIFIC MANNER IN THE BRAIN AND NNOS BETA AND GAMAA OCCUR IN A REGION-SPECIFIC MANNER IN THE BRAIN AND NNOS BETA AND GAMAA OCCUR IN A REGION-SPECIFIC MANNER IN THE BRAIN AND NNOS BETA EXPRESSION IN ALIE BRAIN AND NNOS BETA EXPRESSION IN AND IN SELECTAL AND CANDITAE SKELETAL AND CANDITAE THE BRAIN AND NNOS BETA EXPRESSION IN AND IS SKELETAL BRAIN AND NNOS BETA EXPRESSION IN THE PAR OF THE BRAIN AND SETAL ENGY OF THE BRAIN AND SETAL ENGY OF THE NOS TO SYNAPTIC MUSRARALLY THE DECREPORE.

1- INDUCTION: THE PDZ DOMAIN IN THE NETRACTION, AND IS SEADONISHED FOR THE NOS TO SYNAPTIC MUSRARALLY THE DECREPORE. IN THE WILLY SHAPPOLY.

2- SERBENDALING COMPLEX IS DISRUPTED AND NNOS IS DISPLACED FROM SARROLLEMAN AND ACCOUNTARTS IN THE CYTOSOL.

2- SIMILARITY: BELONGS TO THE NOS FAMILY.

2- SIMILARITY: BELONGS TO THE NOS FAMILY.

3- SHALLARITY: BELONGS TO THE NOS FAMILY.

THE SANCOLEMBE OF FASTITMITCH WOSCLE FIBER BY ASSOCIATING WITH THE DYSTROPHIN GIRCOPROTEIN COMPLEX.

1. ALTERNATIVE PRODUCTS: 4 ISOFORMS; N-NOS-1 (SHOWN HERE), N-NOS-2, TN-NOS/TN-NOSB AND TEXZ INSERTION; ARE PRODUCED BY ALTERNATIVE SPLICING. TN-NOS/TN-NOSB AND TEXE PRODUCED BY ALTERNATIVE SPLICING. TN-NOS/TN-NOSB AND THERE DEPERED EXONS TEXI (TN-NOS) OR TEXT TROUGHED EXONS TEXI (TN-NOS) OR TEXT TROUGHED PROTEIN WHICH POSSESSES ENZYMATIC ACTIVITY COMPARABLE TO THAT OF N-NOS-1. THE COH-TRUNCATED TEXZ INSERTION ISOFORM IS PRODUCED BY INSERTION OF THE TEXZ EXON BETWEEN EXONS 3 AND 4 OF THE N-NOS-1 ISOFORM, LEADING TO A FRAMESHIFT AND A PREMATURE STOP CODON.

1. TISSUE SPECIFICITY: THE N-NOS-1 ISOFORM IS UBIQUITOUSLY EXPRESSED: DEPECTED IN SKELFTAL MUSCLE AND BRAIN, ALSO IN TESTIS, LUNG AND KIDNEY, AND AT LOW LEVELS IN HEART, ADREAD, CLAND AND RETINA. NOT DETECTED IN THE PLATELETS. THE TN-NOS ISOFORM IS EXPRESSED ONLY IN THE TESTIS. THE TN-NOS ISOFORM IS DETECTED IN THE BRAIN, BUT NOT IN THE HEATEL TEXZ INSERTION ISOFORM IS DETECTED IN THE BRAIN BUT NOT IN THE HEATEL STOP IN THE BRAIN, BUT NOT IN THE HEATEN AND ADDREAD. GLAND.

1. DOMAIN: THE PDZ DOMAIN IN THE N-TERMINAL PART OF THE NEURONAL ISOFORM PARTICIPATES.

1. SOFORM PARTICIPATES IN PROTEIN-PROTEIN INTERACTION, AND IS EXPRESSED.

2. THE THERMAL AND RIDNEY, AT LOW EFFERS IN THE BRAIN, BUT NOT IN THE RESPONDED THE PROTEIN INTERACTION, AND ISOFORM PARTICIPATES.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This SWISS-PROT entry is copyright. 347647
nitric-oxide synthase (EC 1.14.13.39) - rat
c.:Species: Rattus norvegicus (Norway rat)
C.:Date::20-Apr-2000 #sequence_revision 20-Apr-2000 #text_change 16-Jun-2000
C.:Accession: 847647; JC1472
R.:Geng, Y.: Almqvist, M.: Hansson, G.K.
Biochim. Biophys. Acta 1218, 421-424, 1994
A.Title: CDNA cloning and expression of inducible nitric oxide synthase from rat vascula A; Reference number: 847647; MUID:9432551
A.Accession: 847647
A.Molecule type: mRNA
A.Residues: 1-1147 <GENA
A.Molecule type: mNA
A.Residues: 1-1147 <GENA

A. Title: Molecular cloning of endothelial, inducible nitric oxide synthase gene from A; Reference number: S65440

A. Accession: S65440

A. Accession: S65440

A. Status: not compared with conceptual translation
A; Molecule type: mRNA
A, Molecule type: mRNA
A, Molecule type: mRNA
C; Superfamily: nitric-oxide synthase; flavodoxin homology; NADPH--ferrihemoprotein reductase homology cFEH>
C; Superfamily: nitric-oxide synthase; flavodoxin homology cFEH>
F; 566-535 Region: calmodulin binding
F; 556-1124/Domain: NADPH--ferrihemoprotein reductase homology cFEH>
F; 539-618 Region: biopterin binding
F; 539-618 Region: biopterin binding #status predicted

nitric-oxide synthase (EC 1.14.13.39) 2C - human (fragment)
N;Alternate names: nitric oxide synthase II
C;Species: Homo saplens (man)
C;Date: 24-May-1996 #sequence_revision 24-May-1996 #text_change 11-Jun-1999
C;Accession: I39204
R;Bloch, K.D.; Wolfram, J.R.; Brown, D.M.; Roberts, J.D.
Genomics 27, 526-530, 1995
A;Title: Three members of the nitric oxide synthase II gene family (NOS2B, and A;Reference numbers. A57622; MUID:96047340
A;Accession: I39204
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   C, Accession: I46074

C. Function:
A. Description: catalyzes the oxidation of an L-arginine guanidino nitrogen and of NADPH
C. Superfamily: GLGF domain homology; Ravodoxin homology; NADPH--ferrihemoprotein; F:23-95/Domain: GLGF domain homology CGG>
F:725-745/Region: calmodulin binding *status predicted
F:755-1394/Domain: NADPH--ferrihemoprotein reductase homology <FEH>
F:755-1394/Domain: NADPH--ferrihemoprotein reductase homology <FEH>
F:757-935/Domain: Ravodoxin homology <FLX>
F:881-912/Region: FMN binding *status predicted
F:1245-1263,1343-1358/Region: NADP binding *status predicted
F:374/Binding site: phosphate (Ser) (covalent) *status predicted
F:415/Binding site: heme iron (Cys) (axial ligand) *status predicted

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2, Ap

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          begon 1342-13

is Sequence 13, Application US/08880342

is Patent No. 6218179

is Patent No. 6218179

is GENERAL INFORMATION:

APPLICANT: Webster, Keith A.

APPLICANT: Bishopric, Namette H.

APPLICANT: Bishopric, Namette H.

APPLICANT: Green, Christopher J.

TITLE OF INVENTION: Tissue Specific Hypoxia Regulated

TITLE OF INVENTION: Therapeutic Constructs

NUMBER OF SEQUENCES: 37

CORRESPONDENCE ADDRESS:
ADDRESSE: Dehlinger & Associates

STREET: 350 Cambridge Avenue, Suite 250

CITY: Palo Alto

STATE: CA

COUNTRY: USA

ZIP: OF U
    TITLE OF INVENTION: CLONING AND CHARACTERIZATION OF GENES TITLE OF INVENTION: ASSOCIATED WITH LONG-TERM MEMORY NUMBER OF SEQUENCES: 24
CORRESPONDENCE ADDRESS:
ADDRESSEE: Hamilton, Brook, Smith & Reynolds, P.C. STREET: Two Militia Drive CITY: Lexington STARET: Massachusetts

                                                                                                                    This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide fragment from human iNOS which is used in the method

This invention describes an immunoassay method where a sample with a specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the
                                                                                                                                                                       monoclonal antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis; Mab.
                                                                                                                                                 nitric oxide synthase; iNOS; human; immunoassay; detection;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence encoded by the cDNA clone for human hepatocyte inducible

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence represents a peptide from human iNOS which is used in the method of the

Nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase, used for isolated tissue perfusion treatment to enhance
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a method for gene therapy for enhancing and inducing angiogenesis. The method uses a nucleic acid delivery vehicle, which comprises a nucleic acid encoding nitric oxide synthase (NOS). The delivery vehicle is used for the manufacture of a pharmaceutical composition for isolated tissue perfusion treatment. The method is useful for enhancing and/or inducing angiogenesis in patients with endothelial dysfunctions, in particular arteriosclerosis. The present sequence represents an inducible NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Amino acid sequence of a human inducible nitric oxide synthase (NOS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gene therapy; angiogenesis; nucleic acid delivery; arteriosclerosis; nitric oxide synthase; NOS; endothelial dysfunction.
                                 An inducible nitric oxide syntase (iNOS or AAR88464) is the product of a cDNA clone (AAT10115) derived from human hepatocytes induced for iNOS biosynthesis. The iNOS can be obtd. by expression of the CDNA e.g. in mammallan host cells and is used in the development of selective inhibitors of NOS or to treat diseases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ;

                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                       AAQ66914 is from human hepatocyte inducible nitric oxide synthase cDNA clone pHINOS from lambda Zap II cDNA library. The original source was induced human hepatocyte RNA. HINOS cDNA plasmid is pref. transformed in E. coll SOLK (ATCC 69126). The inventors claim a clone with the CDNA sequence in AAQ66914 and a cDNA clone which encodes AAR55764. The cloning and expression of a human tissue nitric oxide synthase cDNA provides a source of the enzyme for therapeutic purposes, for example to prevent the hypotensive shock seen with

specific binding entity (e.g. a monoclonal antibody) reactive to human inducible nitric oxide synthase (iNOS) or mimics of this protein is used to detect the presence of human iNOS protein in the sample. The method can be used for the detection and quantitation of human iNOS in cells and tissues for various pathophysiological conditions such as sepsis, septic shock, myocardial infarction, rejection of tissue in organs following transplantation, monitoring "flare ups" in certain autoimmune diseases such as lupus, psoriasis, and multiple sclerosis. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Inducible nitric oxide synthase; iNOS; rat; immunoassay; detection; monoctional antibody; mimic; quantitation; sepsis; septic shock; lupus; myocardial infarction; tissue rejection; transplantation; psoriasis; autoimmune disease; multiple sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                             This invention describes an immunoassay method where a sample with a
                                                                                                                                                                                                                                                                                 Detection of human inducible nitric oxide synthase - using an immunoassay in which a sample is contacted with a specific binding entity reactive with human iNOS or mimics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 18;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention relates to use of a nucleic acid delivery vehicle comprising a nucleic acid encoding nitric oxide synthase (NOS) activity for the manufacture of a composition for essentially isolated tissue perfusion treatment to enhance and/or induce anglogenesis. The nucleic acid delivery vehicle is particularly useful in gene therapy for the treatment of atherosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
cellular calcium levels. Vectors contg. the DNA are used in the treatment or prevention of vascular diseases, high blood pressure, arteriosclerosis, stenosis or restenosis of blood vessels, esp. coronary vessels after percutane transluminal coronary angioplasty. See AAR77363 and AAR77362 for endothelial and brain-derived NOS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to two DNA molecules encoding inducible nitric oxide synthase (iNOS) proteins, where the DNA molecules comprise defined sequences of 4041 and 4165 base pairs given in the specification and the proteins have 1144 amino acids. Also claimed are expression vectors containing the DNA molecules, and recombinant host cells containing the vectors. The DNA molecules are useful for producing the recombinant proteins. The present sequence represents inducible nitric oxide, long
                                                                                                                                                                                                                                                                                                                        Gaps

Treatment of insulin dependent diabetes mellitus (IDDM) can be achieved by by blocking nitric oxide (NO) production in a pancreatic beta cell and by providing a composition comprising an agent that reduces levels of fatty acids in the cells can diprotects beta-cells of the subject against lipid-mediated cell ceath. Cells can also be protected against lipid-mediated cell cath protective by introducing into the cell an antioxidising agent. The methods can be used for protecting cells against immunotoxicity mediated by, e. g. IL-1 beta, IL-1 alpha, gamma IRN, TNF alpha, TNF beta, IL-8, IL-1 IL-6, IL-7, IL-7, IL-7, IL-7, IL-7, IL-7, IL-7, IL-1, IL-1,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Protection of mammalian cells against immunotoxicity or lipotoxicity - used for treating, e.g. diabetes, obesity, wasting syndromes, osteoporosis, inflammatory diseases, autoimmune diseases or neurodegenerative diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diabetes mellitus; treatment; therapy; nitric oxide; NO; beta cell;
fatty acid; lipotoxic; cytotoxic; cytokine; osteoporosis;
inflammatory disease; autoimmune disease; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Inhibition of cytokine mediated immunotoxicity of cells can be

synthase (iNOS) (AAM02571) was deduced from conn clones (see also AAT32655) obtd. from rat penile smooth muscle cells (PSMC). 6 Amino acid differences were found from vascular iNOS sequences. Recombinant iNOS or iNOS-expressing transformed PSMC cells can be used to ameliorate erectile vasculogenic dysfunction in the penis for the treatment of impotence (NO is the main mediator of erection). The transformed cells can be implanted directly into corpora cavernosa or retained in microcapsules, pellets, etc., allowing in
